

Computational Project Paper

In addition to the presentation that you will be giving during the final exam period you should bring a short paper about your project. It should include a description of the question you sought to answer, the equation you solved numerically and a brief statement of how you did it (e.g. if it was a differential equation what integration what technique you used), a graph of your results and a brief interpretation of them. I would expect the text of this paper to be in the ball park of 3-5 pages, some of it directly excerpted from your proposal. If you have less to say don't drag it out, if you have more that works too.
