

Chapter 14 Homework:

1. When we used the commandline/terminal program in class to walk around the memory of the computer we found two strange objects, . and .., lurking in each directory we visited. We discovered that .. is the directory that is one level down on the directory tree. Figure out what . is by exploring where it takes you and try to come up with a plausible reason as to why . might be useful.
2. Write a program that calculates the first 100 values in the Fibonacci sequence to writes them to a file that is on your desktop, regardless of where the program is sitting on your computer.
3. Read in data.txt (the accompanying comma separated file). For each row subtract the first column of information from the second and print out the results to a file called results.txt.
