

Voltage Dividers: good for signals  
poor for power conversion

Example: Convert  $120V_{\text{rms}}$   $\rightarrow 12V_{\text{rms}}$  to run  $10\Omega$  load.

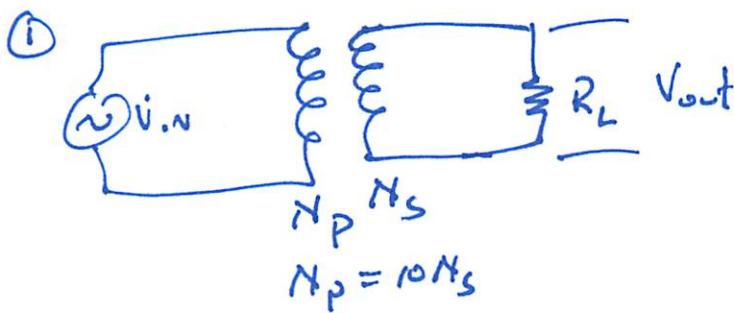

2 methods

(1) Ideal transformer

$$V_{\text{out}} = \frac{N_s}{N_p} V_{\text{in}} \text{ AND } P_{\text{in}} = P_{\text{out}}$$

(2) Ideal Voltage divider

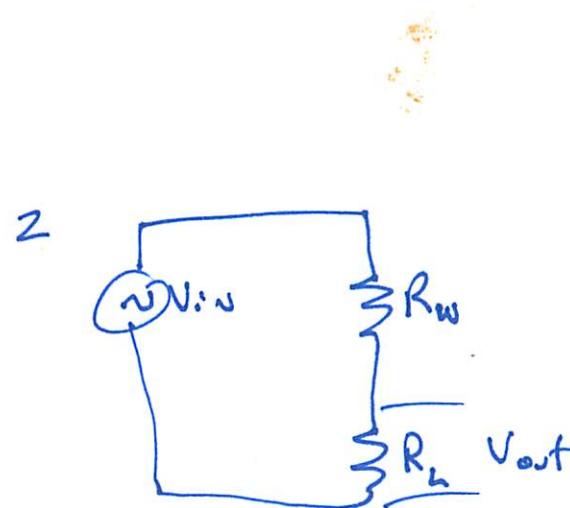

$$V_{\text{out}} = \frac{R_L}{R_T} V_{\text{in}}$$

$$V_{\text{out}} = \frac{N_s}{N_p} V_{\text{in}} = \frac{V_{\text{in}}}{10} = 12V_{\text{rms}}$$

$$P_{\text{out}} = \frac{V_{\text{rms}}^2}{R} = \frac{(12V_{\text{rms}})^2}{10\Omega} = 14.4V^2 \Omega^{-1} = 14.4W$$

$$P_{\text{in}} = P_{\text{out}} = 14.4W$$

$$V_{\text{out}} = \frac{R_L}{R_L + R_W} V_{\text{in}}$$

$$R_W = 90\Omega$$

$$P_{\text{out}} = \frac{(12V_{\text{rms}})^2}{10\Omega}$$

$$= 14.4W$$

$$P_{\text{in}} = \frac{(120V_{\text{rms}})^2}{100\Omega}$$

$$= 144W$$

$\Rightarrow 90\%$  waste

Diagram of loop : initial position  
rotated  $90^\circ$  clockwise

Ans. or Ans 1  $\rightarrow$  initial form (segment 1)  
loop back

Loop 2  
constant  $\omega_{\text{ext}}$  (1)  
initial  $\omega_0 = \omega_0$  at  $t=0$

Winkelt  $\theta(t)$  (2)  
 $\omega_0 = \omega_0$  at  $t=0$

$$\dot{\theta} = \frac{\omega_0}{l} \sin \theta$$

$$\frac{d\theta}{dt} = \frac{\omega_0}{l} \sin \theta$$
$$t_{\text{stop}} = \frac{\pi}{\omega_0}$$

$$\underline{\underline{\text{Ans 1}}} = t_{\text{stop}}$$

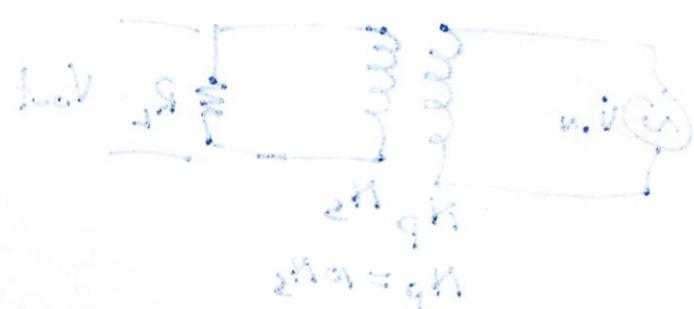

$$\omega_{\text{stop}} =$$

$$\frac{\omega_0 \sin \theta}{l}$$

$$t_{\text{stop}} =$$

$$\omega_0 t =$$

$$t_{\text{stop}} = \frac{\pi}{\omega_0}$$

$$\omega_{\text{ext}} = \frac{\omega_0}{l_1} = \frac{\omega_0}{l_2} = \omega_0$$

$$\frac{d\theta_1}{dt} = \frac{\omega_0}{l_1} \sin \theta_1$$
$$\frac{d\theta_2}{dt} = \frac{\omega_0}{l_2} \sin \theta_2$$

$$\underline{\underline{\text{Ans 2}}} =$$

$$\omega_{\text{stop}} = \frac{\omega_0}{l_1} = \omega_0$$
