Semiconductor questions:

1.

- a. To become ionized the electron must leave the bound states of the atom. E=0 and above are free states so 4eV is needed.
- b. The energy gap is $1.0 \text{ eV} = k_B T$ so T = 12000 K.
- 2. The energy goes into a 0.7eV photon (infrared)
- 3. You would expect light to come out, lambda=539nm, so green light.
- 4. The positive ions are stuck to the lattice.
